

SSB-11

2 Methods of reporting TX IMD:

Many publications add 6 dB to the measurement and call the distortion in respect to PEP.

Simply add 6 dB to the standard values if you prefer the PEP method.

The PEP method has no effect on actual distortion, it just makes the published number [look] larger.

Comment by DJ0IP: When comparing the IMD of different transceivers or amplifiers, be sure both values being stated are using the same method.
